

Plasma Pen Fibroblasting

Plasma Pen® skin tightening (also known as “fibroblasting”) uses tiny bursts of plasma to tighten, firm and rejuvenate the skin. We usually see immediate tightening of the skin, and it stimulates the skin to step up collagen production for months afterward. Plasma Pen is used to treat wrinkles, loose skin and scars on the face and body. Unlike most modalities, we can treat the upper eyelid and the under-eye area, as well as crow’s feet, lip lines and the lower face. Numbing cream is applied to ensure you are comfortable, and most patients report little to no discomfort. Tiny pulses of plasma from the pen are applied individually to the skin which creates miniature dots or crusts on the skin. You can resume normal activities the next day, but there will be tiny brown dots in the treatment area. Makeup is allowed after about one week when the skin is fully healed.
